

8. Project Demonstration Phase

Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

Demonstration Overview

The Project Demonstration Phase is the final phase of the project. It is used to demonstrate the working of the Script-Controlled ACL and explain how record access is restricted based on a specific field value.

The demonstration shows the ACL configuration, script logic, and access results.

Demonstration Preparation

Before starting the demonstration, the following items are prepared:

- ServiceNow instance
- Required table and records
- Selected field for access control
- Configured ACL
- ACL script
- Test users
- Test records with different field values
- 4. Demonstration Procedure

The project can be demonstrated through the following steps:

1. Open the ServiceNow instance.
2. Open the required table.
3. Show the selected field used for access control.
4. Open the configured ACL.
5. Explain the ACL script and its condition.
6. Login or test using an authorized user.
7. Request a record with a matching field value.
8. Show that access is allowed.

9. Test using a user with a non-matching value.
10. Show that access is restricted.

Working Demonstration

For example, if Department is the selected field, a record belonging to a particular department is requested.

When the user's department matches the record's department, the ACL allows access.

When the user's department does not match the record's department, the ACL restricts access.

This demonstrates how the script dynamically controls record-level access.

Demonstration Result

The expected demonstration results are:

Test Condition	Result	Matching field value	Access Allowed	Non-matching field value
Access Restricted				

The results show that the ACL performs the required field-value check before providing access.

Key Points Explained During Demonstration

The following points can be explained during the project demonstration:

- Purpose of the ACL
- Selected field and its importance
- Script-based access condition
- Record-level security
- Authorized and unauthorized access
- Testing results
- Security benefits

Conclusion

The Project Demonstration Phase presents the complete working of the Script-Controlled ACL – Restrict Record Access Based on Field Value project.

The demonstration proves that the ACL can evaluate a field value and control record access accordingly. Matching conditions allow access, while non-matching conditions restrict access.

Thus, the project demonstrates the use of scripting with ACLs to provide controlled and secure record-level access.
