

Empathy Map

Date	29 September 2026
Team ID	SWTID-2026-1307
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

Problem addressed: standard role-based ACLs cannot restrict access to individual records based on a field value (e.g., Confidential, HR-only, department, or assignment group). This project uses script-controlled ACLs to close that gap.

SAYS • “Only the right people should see records marked Confidential.” • “Why can everyone with the ITIL role open this incident?” • “Role-based ACLs are too broad — I need control at record level.” • “Can we restrict access based on the field value or department?”	THINKS • Sensitive data may be exposed to unauthorized users if access is not tightened. • A script-based condition (e.g., checking a field value) could solve this without complex customization. • If a rule is written wrongly, legitimate users may get locked out — it must be tested carefully. • Compliance and audit teams will ask how access is controlled.
ARUN KUMAR (ServiceNow Administrator / Security & Access Control Owner)	
DOES • Reviews existing ACLs and identifies records that are visible to too many users. • Writes ACL scripts using <code>current</code> field values and <code>gs.hasRole()</code> checks. • Tests with different user roles using impersonation. • Reviews logs and fixes ACL conflicts or access issues.	FEELS • Worried about data leaks and security breaches. • Frustrated by the limits of basic role-based access. • Anxious about breaking access for genuine users. • Confident and relieved once field-based restrictions work correctly.
