Project Name	Script-Controlled ACL Restrict Record Access Based on Field Value
Maximum Marks	2 Maks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1 Requirement & Access Planning	Stage 2 Script ACL Configuration	Stage 3 Testing, Deployment & Monitoring
Actions 3 2 « 3/4 3 - 1/2 3/4 - 1/4 3/4 1	" Identifies sensitive records (e.g., incidents or HR cases) that must be hidden based on a field value " Defines which field (e.g., Priority, Department, Confidential) and value control access " Lists the roles and users who may or may not view the records	" Creates a new ACL (table / field, read operation) in ServiceNow " Writes the ACL script with a condition on the field value, e.g. current.field == 'value' " Sets answer = true or false and assigns the required roles	" Impersonates users with different roles to test record access " Verifies restricted records are hidden and permitted records stay visible " Moves the update set to production and reviews logs
Touchpoint 3 2 « 3/4 3 1/4 4 0 3/4 - 1/2 1 3/4 3 - 0 3/4 - 3/4 1/4 - 3/4 3/4 1	" Requirement discussion with stakeholders " Security / data-classification policy documents " ServiceNow table and form view	" Elevated role (security_admin) in ServiceNow " System Security > Access Control (ACL) module " Script editor in the ACL record	" Impersonate User feature and list views " ACL debugging tools / Security Debugger and System Logs " Update Sets and production instance
Customer Thought 3 2 « 3/4 3 1/2 3/4 - 1/2 3/4 - 1, 3/4 3, 1/2 3, ± 1	" "Which records really need protection and why?" " "Can access be decided by one field value?" " "Will restricting access break existing workflows?"	" "Is my script condition correct and secure?" " "Will this ACL conflict with existing ACLs?" " "Is a scripted ACL better than a simple condition?"	" "Are unauthorized users truly blocked?" " "Is any valid user losing access by mistake?" " "Will this run smoothly in production?"

Customer Feeling <i>What is the customer feeling?</i>	Concerned about data exposure, but motivated to secure records	Focused and slightly cautious; nervous about scripting errors	Relieved and confident once tests pass; satisfied with secured data
Process Ownership <i>Who is in the lead on this?</i>	Business Analyst / Data Owner with the Security Officer	ServiceNow Administrator / Developer	QA Tester and Release Manager; Admin for ongoing monitoring
Opportunities <i>How can we improve this stage?</i>	- Provide a data-classification template to capture field-value rules early - Involve security and business owners in sign-off - Document role-to-record access in a matrix	- Provide reusable ACL script templates and coding standards - Add comments and use Script Includes for reusable logic - Peer-review scripts before saving	- Create automated test cases for each role - Enable ACL debugging and audit logging - Schedule periodic access reviews and update documentation
